Just What is Waving in Matter Waves?

For waves in an ocean, it’s the water that “waves”
For sound waves, it’s the molecules in medium
For light it’s the \( E \) \& \( B \) vectors that oscillate

- What’s “waving” for matter waves?
  - It’s the PROBABLILITY OF FINDING THE PARTICLE that waves!
  - Particle can be represented by a wave packet
    - At a certain location (x)
    - At a certain time (t)
    - Made by superposition of many sinusoidal waves of different amplitudes, wavelengths \( \lambda \) and frequency \( f \)
  - It’s a “pulse” of probability in spacetime

What Wave Does Not Describe a Particle

- What wave form can be associated with particle’s pilot wave?
- A traveling sinusoidal wave? \( y = A \cos (kx - \omega t + \Phi) \)
- Since de Broglie “pilot wave” represents particle, it must travel with same speed as particle …..(like me and my shadow)

\[ k = \frac{2\pi}{\lambda}, \quad w = 2\pi f \]

Phase velocity \( (v_p) \) of sinusoidal wave: \( v_p = \lambda f \)

In Matter:

\[
\begin{align*}
(a) \quad \lambda &= \frac{h}{p} = \frac{h}{\gamma mv} \\
(b) \quad f &= \frac{E}{h} = \frac{\gamma mc^2}{h}
\end{align*}
\]

\[ \Rightarrow v_p = \lambda f = \frac{E}{p} = \frac{\gamma mc^2}{v} = \frac{c^2}{v} > c! \]

Conflicts with Relativity \( \rightarrow \) Unphysical

Single sinusoidal wave of infinite extent does not represent particle localized in space

Need “wave packets” localized Spatially (x) and Temporally (t)
Wave Group or Wave Pulse

- Wave Group/packet:
  - Superposition of many sinusoidal waves with different wavelengths and frequencies
  - Localized in space, time
  - Size designated by $\Delta x$ or $\Delta t$
  - Wave groups travel with the speed $v_g = v_0$ of particle

- Constructing Wave Packets
  - Add waves of diff $\lambda$,
  - For each wave, pick
    - Amplitude
    - Phase
  - Constructive interference over the space-time of particle
  - Destructive interference elsewhere!

Imagine Wave pulse moving along a string: its localized in time and space (unlike a pure harmonic wave)

How To Make Wave Packets: Just Beat it!

- Superposition of two sound waves of slightly different frequencies $f_1$ and $f_2$, $f_1 \approx f_2$
- Pattern of beats is a series of wave packets
- Beat frequency $f_{\text{beat}} = f_2 - f_1 = \Delta f$
- $\Delta f = \text{range of frequencies that are superimposed to form the wave packet}$

Displacement

Duration $\Delta t$
Resulting wave's "displacement" \( y = y_1 + y_2 \):

\[
y = A \left[ \cos(k_1 x - w_1 t) + \cos(k_2 x - w_2 t) \right]
\]

Trigonometry: \( \cos A + \cos B = 2 \cos \left( \frac{A + B}{2} \right) \cos \left( \frac{A - B}{2} \right) \)

\[
\therefore y = 2A \left[ \cos \left( \frac{k_2 - k_1}{2} x - \frac{w_2 - w_1}{2} t \right) \cos \left( \frac{k_2 + k_1}{2} x - \frac{w_2 + w_1}{2} t \right) \right]
\]

since \( k_2 \approx k_1 \approx k_{ave} \), \( w_2 \approx w_1 \approx w_{ave} \), \( \Delta k \ll k \), \( \Delta w \ll w \)

\[
\therefore y = 2A \left[ \cos \left( \frac{\Delta k}{2} x - \frac{\Delta w}{2} t \right) \cos(kx - wt) \right] = y = A' \cos(kx - wt), \ A' \text{ oscillates in } x, t
\]

\[
A' = 2A \left[ \cos \left( \frac{\Delta k}{2} x - \frac{\Delta w}{2} t \right) \right] = \text{modulated amplitude}
\]

Phase Vel \( V_p = \frac{w_{ave}}{k_{ave}} \)

Group Vel \( V_g = \frac{\Delta w}{\Delta k} \)

\( V_g : \text{Vel of envelope} = \frac{d w}{d k} \)

Addition of 2 Waves with slightly different wavelengths and slightly different frequencies

Non-repeating wave packet can be created thru superposition
Of many waves of similar (but different) frequencies and wavelengths
Wave Packet: Localization

- Finite # of diff. Monochromatic waves always produce INFINITE sequence of repeating wave groups → can’t describe (localized) particle
- To make localized wave packet, add “infinite” # of waves with Well chosen Amplitude A, Wave# k, ang.

\[ \psi(x, t) = \int_{-\infty}^{\infty} A(k) e^{i(kx - \omega t)} dk \]

\[ A(k) = \text{Amplitude Fn} \]
\[ \Rightarrow \text{diff waves of diff k have different amplitudes } A(k) \]
\[ w = w(k), \text{depends on type of wave, media} \]

Group Velocity \( V_g = \frac{d\omega}{dk} \)

\( \omega = \omega(k), \text{depends on } t, \lambda \)

In a Wave Packet: \( w = w(k) \)

Group Velocity \( V_g = \frac{dw}{dk} \)

Since \( V_p = \omega k \) (def) \( \Rightarrow w = kV_p \)

\[ \therefore V_g = \frac{d\omega}{dk} = V_p \bigg|_{k = k_0} + k \frac{dV_p}{dk} \bigg|_{k = k_0} \]

usually \( V_p = V_p(k \ or \lambda) \)

Material in which \( V_p \) varies with \( \lambda \) are said to be Dispersive

Individual harmonic waves making a wave pulse travel at different \( V_p \) thus changing shape of pulse and become spread out

In non-dispersive media, \( V_g = V_p \)

In dispersive media \( V_g \neq V_p \), depends on \( \frac{dV_p}{dk} \)

1ns laser pulse disperse
By x30 after travelling 1km in optical fiber
Group Velocity of Wave Packets: $v_g$

Consider an electron:
- Mass = $m$
- Velocity = $v$
- Momentum = $p$

Energy $E = hf = mc^2$; $\omega = 2\pi f = \frac{2\pi}{h} \gamma mc^2$

Wavelength $\lambda = \frac{h}{p}$; $k = \frac{2\pi}{\lambda} \Rightarrow k = \frac{2\pi}{h} \gamma mv$

Group Velocity: $v_g = \frac{dw}{dk} = \frac{dv}{dv} = v$ \Rightarrow Group velocity of electron Wave packet "pilot wave" is same as electron's physical velocity.

But velocity of individual waves making up the wave packet $v_p = \frac{w}{k} = \frac{c^2}{v} > c$! (not physical)

Wave Packets & Uncertainty Principles

We added two Sinusoidal waves

$y = 2A \left[ \cos \left( \frac{kx}{2} \right) \cos \left( \frac{\Delta k}{2} \Delta x \right) \cos \left( \frac{\Delta w}{2} \Delta t \right) \cos kx - wt \right]$

Amplitude Modulation

- Distance $\Delta X$ between adjacent minima $= (X_2)_{\text{node}} - (X_1)_{\text{node}}$
- Define $X_1 = 0$ then phase diff from $X_1 \rightarrow X_2 = \pi$ (similarly for $t_1 \rightarrow t_2$)

What can we learn from this simple model?

Node at $y = 0 = 2A \cos \left( \frac{\Delta k}{2} \Delta x - \frac{\Delta w}{2} \Delta t \right)$, Examine x or t behavior

$\Rightarrow$ in x: $\frac{\Delta k}{\Delta x} = \pi$ \Rightarrow Need to combine many waves of diff. $k$ to make small $\Delta x$ pulse

$\Delta x = \frac{\pi}{\Delta k}$, for small $\Delta x \rightarrow 0 \Rightarrow \Delta k \rightarrow \infty$ & Vice Verca

and in t: $\frac{\Delta w}{\Delta t} = \pi$ \Rightarrow Need to combine many waves of diff $\omega$ to make small $\Delta t$ pulse

$\Delta t = \frac{\pi}{\Delta \omega}$, for small $\Delta t \rightarrow 0 \Rightarrow \Delta \omega \rightarrow \infty$ & Vice Verca
Signal Transmission and Bandwidth Theory

- Short duration pulses are used to transmit digital info
  - Over phone line as brief tone pulses
  - Over satellite link as brief radio pulses
  - Over optical fiber as brief laser light pulses
- Regardless of type of wave or medium, any wave pulse must obey the fundamental relation
  \[ \Delta \omega \Delta t \cong \pi \]
- Range of frequencies that can be transmitted are called bandwidth of the medium
- Shortest possible pulse that can be transmitted thru a medium is \[ \Delta t_{\text{min}} \cong \frac{\pi}{\Delta \omega} \]
- Higher bandwidths transmits shorter pulses & allows high data rate

Wave Packets & Uncertainty Principles of Subatomic Physics

in space x: \[ \Delta k \Delta x = \pi \] \implies \text{ since } \frac{2\pi}{\lambda}, \frac{p}{\lambda} \\
\implies \Delta p \Delta x = \frac{h}{2} \\
\text{usually one writes } \Delta p \Delta x \geq \frac{h}{2} \text{ approximate relation}

In time t: \[ \Delta \omega \Delta t = \pi \] \implies \text{ since } \omega = 2\pi f, E = hf \\
\implies \Delta E \Delta t = \frac{h}{2} \\
\text{usually one writes } \Delta E \Delta t \geq \frac{h}{2} \text{ approximate relation}

What do these inequalities mean physically?
Know the Error of Thy Ways: Measurement Error $\rightarrow \Delta$

- Measurements are made by observing something: length, time, momentum, energy.
- All measurements have some (limited) precision…no matter the instrument used.
- Examples:
  - How long is a desk? $L = (5 \pm 0.1) \, \text{m} = L \pm \Delta L$ (depends on ruler used).
  - How long was this lecture? $T = (50 \pm 1) \, \text{minutes} = T \pm \Delta T$ (depends on the accuracy of your watch).
  - How much does Prof. Sharma weigh? $M = (1000 \pm 700) \, \text{kg} = m \pm \Delta m$.

  - Is this a correct measure of my weight?
    - Correct (because of large error reported) but imprecise.
    - My correct weight is covered by the (large) error in observation.

Length Measure

Voltage (or time) Measure

Measurement Error: $x \pm \Delta x$

- Measurement errors are unavoidable since the measurement procedure is an experimental one.
- True value of an measurable quantity is an abstract concept.
- In a set of repeated measurements with random errors, the distribution of measurements resembles a Gaussian distribution characterized by the parameter $\sigma$ or $\Delta$ characterizing the width of the distribution.

![Gaussian Distribution](image)

The Gauss, or Normal, Distribution

$$G_{X,\sigma}(x) = \frac{1}{\sigma \sqrt{2\pi}} e^{-(x-X)^2/2\sigma^2}.$$
Interpreting Measurements with random Error: $\Delta$

Figure 5.12. The shaded area between $X \pm t\sigma$ is the probability of a measurement within $t$ standard deviations of $X$.

Where in the World is Carmen San Diego?

- Carmen San Diego hidden inside a big box of length $L$
- Suppose you can’t see thru the (blue) box, what is your best estimate of her location inside box (she could be anywhere inside the box)

Your best unbiased measure would be $x = L/2 \pm L/2$

There is no perfect measurement, there are always measurement error
Wave Packets & Matter Waves

What is the Wave Length of this wave packet?

\[ \lambda - \Delta \lambda < \lambda < \lambda + \Delta \lambda \]

De Broglie wavelength \( \lambda = h/p \)

\[ \Rightarrow \text{Momentum Uncertainty: } p - \Delta p < p < p + \Delta p \]

Similarly for frequency \( \omega \) or \( f \)

\[ \omega - \Delta \omega < \omega < \omega + \Delta \omega \]

Planck’s condition \( E = hf = h\omega/2 \)

\[ \Rightarrow E - \Delta E < E < E + \Delta E \]

Back to Heisenberg’s Uncertainty Principle & \( \Delta \)

• \( \Delta x, \Delta p \geq h/4\pi \Rightarrow \)
  – If the measurement of the position of a particle is made with a precision \( \Delta x \) and a SIMULTANEOUS measurement of its momentum \( p_x \) in the X direction, then the product of the two uncertainties (measurement errors) can never be smaller than \( \approx h/4\pi \) irrespective of how precise the measurement tools

• \( \Delta E, \Delta t \geq h/4\pi \Rightarrow \)
  – If the measurement of the energy \( E \) of a particle is made with a precision \( \Delta E \) and it took time \( \Delta t \) to make that measurement, then the product of the two uncertainties (measurement errors) can never be smaller than \( \approx h/4\pi \) irrespective of how precise the measurement tools

These rules arise from the way we constructed the Wave packets describing Matter “pilot” waves

Perhaps these rules Are bogus, can we verify this with some physical picture ??
The Act of Observation (Compton Scattering)

Observations of particle motion by means of scattered illumination. When the incident wavelength is reduced to accommodate the size of the particle, the momentum transferred by the photon becomes large enough to disturb the observed motion.

Visible light illuminating a macroscopic object.

Act of observation disturbs the observed system

Compton Scattering: Shining light to observe electron

\[ \lambda = \frac{h}{p} = \frac{hc}{E} = \frac{c}{f} \]

Recollecting electron

Scattered photon

The act of Observation DISTURBS the object being watched, here the electron moves away from where it was originally.
**Act of Watching: A Thought Experiment**

Photon that goes through are restricted to this region of lens.

**Observed Diffraction pattern**

**Diffraction By a Circular Aperture (Lens)**

See Resnick, Halliday Walker 6th Ed (on S.Reserve), Ch 37, pages 898-900

Diffracted image of a point source of light thru a lens (circular aperture of size $d$)

First minimum of diffraction pattern is located by

\[
\sin \theta = 1.22 \frac{\lambda}{d}
\]

See previous picture for definitions of $\theta, \lambda, d$
Resolving Power of Light Thru a Lens

Image of 2 separate point sources formed by a converging lens of diameter $d$, ability to resolve them depends on $\lambda$ & $d$ because of the inherent diffraction in image formation.

\[
\text{Resolving power } \Delta x \approx \frac{\lambda}{2\sin \theta}
\]

$\theta$ depends on $d$

Putting it all together: act of observing an electron

- Incident light $(p, \lambda)$ scatters off electron
- To be collected by lens $\Rightarrow \gamma$ must scatter thru angle $\alpha$
  - $-\theta \leq \alpha \leq \theta$
- Due to Compton scatter, electron picks up momentum
  - $p_x, p_y$ $\Rightarrow \frac{h}{\lambda} \sin \theta \leq p_z \leq \frac{h}{\lambda} \sin \theta$
  - Electron momentum uncertainty is $\Delta p \approx \frac{2h}{\lambda} \sin \theta$
- After passing thru lens, photon diffracts, lands somewhere on screen, image (of electron) is fuzzy
- How fuzzy? Optics says shortest distance between two resolvable points is:
  - $\Delta x = \frac{\lambda}{2\sin \theta}$

- Larger the lens radius, larger the $\theta \Rightarrow$ better resolution

\[
\Rightarrow \Delta p \Delta x \left( \frac{2h \sin \theta}{\lambda} \right) \left( \frac{\lambda}{2 \sin \theta} \right) = h
\]

\[
\Rightarrow \Delta p \Delta x \geq h / 2
\]
Pseudo-Philosophical Aftermath of Uncertainty Principle

• Newtonian Physics & Deterministic physics topples over
  – Newton’s laws told you all you needed to know about trajectory of a particle
    • Apply a force, watch the particle go!
      – Know every thing! X, v, p, F, a
      – Can predict exact trajectory of particle if you had perfect device

• No so in the subatomic world!
  – Of small momenta, forces, energies
  – Cant predict anything exactly
    • Can only predict probabilities
      – There is so much chance that the particle landed here or there
      – Cant be sure!....cognizant of the errors of thy observations

Philosophers went nuts!...what has happened to nature
Philosophers just talk, don’t do real life experiments!

All Measurements Have Associated Errors

• If your measuring apparatus has an intrinsic inaccuracy (error) of amount $\Delta p$

• Then results of measurement of momentum $p$ of an object at rest can easily yield a range of values accommodated by the measurement imprecision:
  – $-\Delta p \leq p \leq \Delta p$

• Similarly for all measurable quantities like x, t, Energy!
Matter Diffraction & Uncertainty Principle

Incident Electron beam In Y direction

Momentum measurement beyond slit show particle not moving exactly in Y direction, develops a X component Of motion \( \Delta P_X = \frac{h}{2\pi a} \)

Particle at Rest Between Two Walls

- Object of mass \( M \) at rest between two walls originally at infinity
- What happens to our perception of George as the walls are brought in?

On average, measure \( \langle p \rangle = 0 \)
but there are quite large fluctuations!

Width of Distribution = \( \Delta P \)

\[ \Delta P = \sqrt{(P^2)_{\text{ave}} - (P_{\text{ave}})^2}; \quad \Delta P \sim \frac{h}{L} \]
